

#1 #1A: What is the equation of the line of best fit?

Fahrenheit because you can see more detail

#1b: Why does that make sense based on what we know about Celsius and Fahrenheit?

because you can see more detail

#2 #2a: What kind of model best represents our data (linear, quadratic, exponential)?

linear because it does not use any quadratics or exponents

#2b: What is the equation of the line of best fit?

$$y = -21.66x + 24.3$$

#2c: Why does this make sense for representing temperature?

because both Fahrenheit and Celsius have the same slope line, for here I use Celsius to calculate it.
